

$$x_1(t) = u(t) \Phi(t) \quad \text{--- 2nd order}$$

$$\text{微分方程式} \quad \frac{dx_1(t)}{dt} = \frac{d}{dt} u(t) \Phi(t) + u(t) \frac{d\Phi(t)}{dt}$$

$$x_1(t) \text{ is } \text{解} \quad \frac{dx_1(t)}{dt} = A u(t) \Phi(t) + \begin{pmatrix} e^{2t} \\ e^{2t} \end{pmatrix}$$

$$\therefore \frac{d}{dt} u(t) \Phi(t) = 2 \text{nd order}$$

$$\frac{d}{dt} u(t) \Phi(t) = \begin{pmatrix} e^{2t} \\ e^{2t} \end{pmatrix} \quad \therefore u(t) = \int_0^t \Phi^{-1}(t) \begin{pmatrix} e^{2t} \\ e^{2t} \end{pmatrix} dt$$

$$\Phi^{-1}(t) = \begin{pmatrix} 4e^{-t} & 3e^{-t} \\ -e^{-2t} & -e^{-2t} \end{pmatrix} \quad \text{or} \quad u(t) = \begin{pmatrix} 7e^{-t} \\ -2e^{-t} \end{pmatrix}$$

$$\therefore x_1(t) = u(t) \Phi(t) = \begin{pmatrix} 7-6t \\ -7+8t \end{pmatrix} e^{2t}$$

以上より式9 - 解得 $x_1(t)$ is

$$x_1(t) = x_0(t) + x_1(t) = \begin{pmatrix} c_1 e^{1-t} (3c_2 + 7 - 6t) e^{2t} \\ -c_1 e^{1-t} (-4c_2 - 7 + 8t) e^{2t} \end{pmatrix}$$

$$t=0 \text{ at } x_1(0) = \begin{pmatrix} c_1 + 3c_2 + 7 \\ -c_1 - 4c_2 - 7 \end{pmatrix} = \begin{pmatrix} 1 \\ -1 \end{pmatrix}$$

$$\therefore (c_1, c_2) = (-6, 0)$$

$$\text{したがって解は} \quad x_1(t) = \begin{pmatrix} -6e^{1-t} (7-6t) e^{2t} \\ 6e^{1-t} (-7+8t) e^{2t} \end{pmatrix}$$
